Re: Junior DevOps Engineer (Djinni, published on 20 October 2026)

Dear Hiring Manager,

After learning about the Junior DevOps Engineer position at Rangein, I became interested in it because it combines the things I enjoy most: Docker, Linux, automation and keeping services healthy in production. I am a third-year Information Systems and Technologies student at Taras Shevchenko National University of Kyiv, and I would like to apply for this role.

Your job description mentions hands-on Docker experience, Linux, Nginx, networking fundamentals and monitoring. These are exactly the areas I work in every week. For Luxora, a company from Germany, I develop a business website and I am responsible for its deployment: I containerised the application with Docker, deployed it to a Linux VPS behind an Nginx reverse proxy, and now I support and monitor the production environment. This project taught me to take end-to-end ownership of a service.

I understand that my commercial experience is shorter than one to two years. However, my background in networking and security makes up for part of it. I designed a three-tier campus network for more than 700 users, with VLANs, redundant uplinks and security features such as DHCP snooping and ACLs, and I carried out an ISO 27001-based audit and a penetration test for a commercial client. I am also completing the Mate Academy DevOps track to strengthen my CI/CD, Terraform and cloud skills.

I would welcome the opportunity to discuss how I can contribute to your team. My résumé is attached, and you can contact me at petros5325@gmail.com or +380 99 222 7348. Thank you for your time and consideration.

Sincerely,

Petro Kravchenko
